TITLE: Method for calibrating a photofinishing system and
components for use
in such a method

----- KWIC -----

Various modifications can, of course, be made to the above
embodiments. For
example, look up table 162, rather than carrying the
correction factors in a
human readable form on a substrate, could carry the
correction factors in the
form of only machine readable data carried by a suitable
substrate, such as a
machine readable magnetic or optical storage medium (for
example, a computer
diskette) or solid state memory. Of course, the user at a
photofinishing lab
would need a suitable reader (such as a computer) for this
data. The
correction factors when in the form of machine readable
data, may be just
carried by the memory of a computer contained as part of a
computer controlled
printer. This could thereby allow such a computer
controlled printer to
determine the necessary correction factor to be applied to
a printer after the
user has made the visual comparison
